Education

IIIT Allahabad

Nov 2022 – Jun 2026

B.Tech, Information Technology

- **Core Coursework:** Data Structures & Algorithms, Operating Systems, Computer Networks, DBMS
- **Relevant:** Parallel & Distributed Computing, Software Engineering, OOP (Java/C++)

Work Experience

Acko

Jan 2026 – Present

SDE Intern

- Built an end-to-end invitation and family-membership system — creation, WhatsApp delivery, cancellation, and resend — across two microservices, with idempotent state transitions and authorization checks.
- Designed an adherence-tracking and subscription-continuation engine driving automated renew/pause/pivot decisions from recurring delivery data, with lifecycle validation and retry-safe, idempotent action processing.
- Built a financial reporting and settlement pipeline — event ingestion through transaction matching and vendor-payout allocation — later extended into a payment-orchestrator tenant integration with **Razorpay**/bank reconciliation.
- Developed the **OneMG** pharmacy vendor adapter — order creation, confirmation, cancellation, tracking, and catalog sync — with JWT-authenticated vendor communication, powering the clinic's supplement fulfilment pipeline.
- Improved backend correctness and reliability through deduplication, conditional state transitions, transaction-boundary fixes, and targeted tests covering retries, invalid state transitions, and data-integrity edge cases.

Summer Research Intern

May 2025 – Jul 2025

IIIT Allahabad

Under Prof. Ramesh Bhukhya

- Curated and annotated **50,000+** infant cry samples across the BabyChillanto, Donate-a-Cry, and Baby2020 datasets, expanding training data coverage by **35%**.
- Trained and benchmarked **8 machine learning and deep learning models** — including SVM, Random Forest, LightGBM, and CNN+GRU — achieving a **12% performance gain** over baseline models.

Projects

NomNom Planner — AI-Powered Meal Planning SaaS

Repo

Next.js, TypeScript, PostgreSQL, Prisma, Stripe, Clerk, OpenAI

- Developed a full-stack SaaS platform that generates personalized meal plans via OpenAI, with subscription-based access, user authentication, and premium feature gating.
- Managed the full Stripe subscription lifecycle — upgrades, downgrades, and cancellations — with webhook-driven synchronization between billing state and application data.
- Built secure backend APIs with Next.js server routes, Prisma, and PostgreSQL, enforcing role-based access control through Clerk-authenticated protected routes.

Mini Port Scanner — High-Performance Network Tool

Repo

Go, TCP/IP, Concurrency

- Developed a concurrent TCP port scanner leveraging Goroutines and worker pools for parallel network scans, with structured JSON output.
- Added configurable concurrency controls and connection management to efficiently scan large target ranges while optimizing resource utilization.
- Used channel-based task distribution and Go concurrency primitives to maximize scan throughput while keeping resource consumption controlled during large-scale scans.

Technical Skills

Languages: Java, C++, Python, Go, SQL, JavaScript

Methodologies & Tools: Agile/Scrum, Git, Microservices Architecture, REST API Design, CI/CD

Backend & Distributed Systems: Spring Boot, REST APIs, Microservices, OpenFeign, WebClient, AWS SQS, Temporal, Event-Driven Architecture

Databases, Cloud & DevOps: PostgreSQL, AWS RDS, Elasticsearch, AWS, Docker, Jenkins, CI/CD

Observability & Monitoring: Datadog, Coralogix

Achievements

- Finalist, Flipkart Grid
- CodeChef 3* (1770+)
- Solved 1000+ DSA problems.
